

Field Data Capture Application Provides Alternative Economic Solution for Digitalization

Digital transformation in the oil and gas industry can be tough. Our Field Data Capture Application (FDCA) makes it easy and seamless.

Our app provides an alternative option when the economics do not support the use of Well Manager. Key metrics that can be manually collected include chart meters, daily comments, downtime, Environmental, Social, and Governance (ESG) metrics, fuel usage, maintenance, run tickets, treatments, and water draws. This bolt-on option can be fully integrated within our Well Manager solution to provide complete visibility of all assets.

When one of our largest partners started their digitalization journey, progress within Well Manager was substantial. However, well data management flow still depended on manual processes and paper grease books. FDCA was the ideal solution to compliment a successful digital transformation.

How does our field data capture application boost oil and gas companies' digital capabilities?

Well operators enter data via mobile devices in just a few clicks, eliminating dozens of manual processes and paperwork.

Prebuilt site inspection forms with the ability to customize and add as needed. Includes business intelligence (BI) reporting package.

Fully integrated within our Well Manager solution to provide complete visibility of all assets.

Provides a 30-day rolling grid for entry allowing operators visibility to the production history of all included assets and an audit trail of the processes.

Offline capabilities for remote data capture where connectivity is limited or not available.
