

Future Proof Your Data with Automation and Eliminate Manual Processing

Enterprise data management is one of the toughest challenges in oil and gas. It requires an immense amount of paperwork and manual effort. Wasted hours of sorting through documents or overcomplicated data management services is not sustainable.

Digital Oil & Gas Solutions has a unique data management platform for automated processing of all data formats. Our Data Management as a Service (DMaaS) can be implemented as a data warehouse, data lake, or converter for a data swamp to help leverage your information to the best level possible.

Partner with us and get end-to-end data management, free office space, decrease paperwork, increase staff productivity, and ultimately lower your operating costs.

How can DMaaS drive smart oil and gas data management and reporting?

Production, financial, land, forecast, unstructured, semi-structured, and structured data can be ingested quickly and efficiently.

Pay for what you use and keep in hot, warm, and cold storages. No hidden fees or additional expenses on hardware devices.

Make your data easy to find, interpret, and update for swift analysis. Structure the data as it suits you and individual users.

API and ETL help migrate data between apps and warehouses faster and without security risks to easily integrate your legacy data sources and architecture.

Control every corner of your lease and analyze all of your sites to improve business operations and accelerate new asset onboarding.
